

Listening to the teacher can be very boring. If you like an experiment, try!

Almost every experiment contains detailed instructions for you!

How to deal with the experiment's instructions?

1. Choose one subject ([chemistry](#) , [physics](#) , [biology](#)) and an experiment that you want to do.
2. Have a look at the material-list and get every listed material. (Ask your parents for help.)
3. Read the whole instruction before starting the experiment. (Professional Scientists also do this.)
4. Read and implement every point of the instruction step by step!!! If you are not sure ask your parents or another adult person!!!

If the experiment does not work, try it again. For some experiments, you need patience and a steady hand. But we are sure that you will succeed.

5. This step is the most important step: HAVE FUN.
